

How to run (exact commands)

```
chmod +x ~/waf_log_analyzer.py
```

2. Quick verification (test mode — no logs required):

```
python3 ~/waf_log_analyzer.py --test --outdir ~/waf_reports_test
```

You should see a short printed summary and files in ~/waf_reports_test.

3. Run on your real logs (example paths for Kali/Apache & ModSecurity):

```
python3 ~/waf_log_analyzer.py \  
--access /var/log/apache2/access.log \  
--modsec /var/log/modsec_audit.log \  
--outdir ~/waf_reports_$(date +%Y%m%d_%H%M)
```

If your apache logs are rotated, point to the correct file (e.g., access.log.1).
